These instructions are to be stored next to the boiler for reference purposes.

FOR YOUR SAFETY: This product must be installed and serviced by a professional service technician, qualified in hot water boiler installation and maintenance. Improper installation and/or operation could create carbon monoxide gas in flue gases which could cause serious injury, property damage, or death. Improper installation and/or operation will void the warranty.

WARNING
If the information in this manual is not followed exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance.

WHAT TO DO IF YOU SMELL GAS
• Do not try to light any appliance.
• Do not touch any electrical switch; do not use any phone in your building.
• Immediately call your gas supplier from a nearby phone. Follow the gas supplier’s instructions.
• If you cannot reach your gas supplier, call the fire department.

Installation and service must be performed by a qualified installer, service agency, or gas supplier.

AVERTISSEMENT
Assurez-vous de bien suivres les instructions données dans cette notice pour réduire au minimum le risque d’incendie ou d’explosion ou pour éviter tout dommage matériel, toute blessure ou la mort.

Ne pas entreposer ni utiliser d’essence ni d’autres vapeurs ou liquides inflammables dans le voisinage de cet appareil ou de tout autre appareil.

QUE FAIRE SI VOUS SENTEZ UNE ODEUR DE GAZ:
• Ne pas tenter d’allumer d’appareils.
• Ne touchez à aucun interrupteur. Ne pas vous servir des téléphones dansle bâtiment où vous êtes.
• Appelez immédiatement votre fournisseur de gaz depuis un voisin. Suivez les instructions du fournisseur.
• Si vous ne pouvez rejoindre le fournisseur de gaz, appelez le sservice des incendies.

L’installation et l’entretien doivent être assurés par un installateur ou un service d’entretien qualifié ou par le fournisseur de gaz.

SECTION 1.
General Information

1A. Introduction

This manual provides information necessary for the installation, operation, and maintenance of the Laars Mini-Therm model JV low pressure, copper tube hydronic boilers. These boilers are available in two configurations; the JVH has a hot surface pilot ignition system and the JVS has an electronic intermittent ignition device (I.I.D.). Look for the model designation on the rating plate, which can be found on top of the boiler.

All application and installation procedures should be reviewed completely before proceeding with the installation. Consult the Laars factory, or local factory representative, with any problems or questions regarding this equipment. Experience has shown that most operating problems are caused by improper installation.

WARNING

This hydronic boiler must be installed in accordance with the procedures detailed in this manual, or the Laars warranty will be voided. The installation must conform to the requirements of the local jurisdiction having authority, and, in the United States, to the latest edition of the National Fuel Gas Code, ANSI Z223.1. In Canada, the installation must conform with the latest edition of CAN/CGA B149.1 OR .2 installation codes for gas burning appliances, and/or local codes.

Any modifications to the boiler, its gas controls, gas orifices, wiring or draft inducer assembly may void the warranty. If field conditions require modifications, consult the factory representative before initiating such modifications.

ATTENTION

L’ eau chaude chaudière doit être installé en conformité avec les procédures détaillées dans ce manuel, ou le Laars garantie sera annulée. L’installation doit être conforme aux exigences de la juridiction locale ayant l'autorité, et, aux ÉTATS-UNIS , à la dernière édition du National gaz carburant Code, ANSI Z223.1. Au Canada, l’installation doit être conforme à la plus récente édition de la norme CAN/CGA B149.1 ou .2 codes d'installation gaz pour appareils de combustion et/ou codes locaux.

1B. Warranty

The Laars Mini-Therm model JV boilers are covered by a limited warranty. The owner should complete the warranty registration online by going to www.Laars.com and select the 'Support' pull-down to find the new product warranty registration form.

All warranty claims must be made to an authorized Laars representative or directly to the factory. Claims must include the boiler serial number and model (this information can be found on the rating plate), installation date, and name of the installer. Shipping costs are not included in the warranty coverage.

Some accessory items are shipped in separate packages. Verify receipt of all packages listed on the packing slip. Inspect everything for damage immediately upon delivery, and advise the carrier of any shortages or damage. Any such claims should be filed with the carrier. The carrier, not the shipper, is responsible for shortages and damage to the shipment whether visible or concealed.

The warranty does not cover damage caused by improper assembly installation, operation or field modification.

WARNING:
Cancer and Reproductive Harm
www.P65Warnings.ca.gov.
As required by the State of California Proposition 65.
1C. Model Number and Nomenclature

The rating plate on the side of your Mini-Therm shows your Model Number. The original characteristics of your unit can be identified using this nomenclature from your Model Number.

SECTION 2.
Boiler Assembly and Placement

2A. Field Assembly

The Mini-Therm JV is available in two configurations. The JVH has a hot surface ignition pilot and integral draft fan, and the JVS has an electronic intermittent ignition device (I.I.D.). Look for the model designation on the rating plate, which can be found on right side of the boiler, just above the drain.

The Laars automatic vent dampers are standard on all JVS models. The Laars side wall power venters can be used on JVS models. Special instructions for their installation are included in the vent damper and power venter package. Read them carefully before installation.
Vent Damper (JVS only):
1. Mini-Therm JVS boilers have built-in draft diverter for natural draft operation.
2. Find the vent damper box which is located in the boiler package.
3. Install the vent damper directly to the top of the draft diverter outlet with the damper operator facing to the front of the boiler, and with the flow direction arrow pointing upward. Use the vent damper wire harness provided with the boiler to connect the vent damper to the boiler. The bracket end of the harness should be connected to the vent damper actuator.
4. For Model JVS only: Install the metal plug provided with the vent damper onto the damper plate hole.
5. Do not modify the automatic vent damper device. It is very important that no other vents are closed. Provide at least six inches clearance between the automatic vent damper and combustible construction, and be sure to allow access for servicing the damper.

Temperature/Pressure Gauge: Install the temp/pressure gauge provided in the parts box.

2B. Boiler Placement
1. The boiler must be placed to provide clearances on all sides for maintenance and inspection. There must also be minimum distances maintained from combustible surfaces. Avoid locations which can be damaged by water or moisture.
2. A minimum of 15" (381mm) access must be available in front of the boiler for burner tray removal. Consult local codes for clearances to hot water pipes and accessories.
3. If the boiler is to be installed in a garage, all burners and burner ignition devices must have a minimum 18" (457mm) clearance above the floor.
4. Boilers can be installed in a closet as long as the minimum clearances shown in Table 2 are observed. Special attention should be paid to clearances between the front of the boiler and the closet door when it is closed (see Figure 2).

2C. Flooring
JVS model boilers can only be installed on noncombustible flooring.

JVH model boilers are designed and certified for installation on a combustible floor.

All boilers must be installed on a level floor and must NEVER be installed on carpeting. NEVER store objects on or around the boiler.

Noncombustible flooring is defined as flooring material and surface finish not capable of being ignited and burning and with no combustible materials against the underside. Acceptable materials are those consisting entirely of a combination of steel, iron, brick, tile, concrete, slate, glass or plaster.

The JVS model boilers can be installed on a combustible floor if a noncombustible base assembly, available from Laars, is used. See the JVS Parts List at the back of this manual for the appropriate Noncombustible Base Kit part number.

Figure 1. Typical Combustible Floor Installation.

As an alternative to the Laars Noncombustible Base Kit, in the United States the National Fuel Gas Code allows a heater to be placed on a combustible surface when there is a platform under the heater made of hollow masonry no less than 4 inches (102 millimeters [mm]) thick, covered with sheet metal at least 24 gauge thick and extending beyond the full...

</table>
width and depth of the heater by at least 12 inches (305mm) in all directions. The masonry must be laid with ends unsealed, and joints matched to provide free circulation of air from side to side through the masonry (see Figure 1). If the boiler is installed in a carpeted alcove, the entire floor of the alcove must be covered by a noncombustible platform.

2E. Clearance / Closet Installations

All Mini-Therm JV's can be installed in a closet as long as the minimum clearances are observed.

See Table 2JVH and Figure 2JVH for clearances required for the Mini-Therm JVH.

See Table 2JVS and Figure 2JVS for clearances required for the Mini-Therm JVS

Special attention should be paid to clearances between the front of the boiler and the closet door when it is closed.

**Figure 2JVH. Closet Installation.**

**Figure 2JVS. Closet Installation.**
SECTION 3.
Air and Venting

3A. Combustion Air Supply
The boiler location must provide sufficient air supply for proper combustion, and ventilation of the surrounding area as outlined in the latest edition of U.S. ANSI standard Z223.1 or in Canada, CAN/CGA-B149.1 or .2, and any local codes that may be applicable.

In general, these requirements specify that the boiler rooms which represent confined spaces should be provided with two permanent air supply openings; one within 12 inches (305mm) of the ceiling, the other within 12 inches (305mm) of the floor.

**NOTE:** In Canada, follow Canadian Standard, CAN/CGA-B149 or local codes.

**Outside Air Supply:** When combustion air is supplied directly through an outside wall, each opening should have a minimum free area of one square inch per 4,000 BTU/h (6 sq. cm per 1.2 kW) input of the total input rating of all appliances in the enclosed area.

**Inside Air Supply:** When combustion is supplied from inside the building, each opening should have a minimum free area of one square inch per 1,000 BTU/h (6 sq. cm per 0.3 kW) input of the total input rating of all appliances in the enclosed area. These openings should never be less than 100 square inches (645 sq. cm).

</tbody>
</table>

*Area indicated is for one of two openings: one at floor level and one at the ceiling, so the total net free area would be double the figures shown. For special conditions, refer to NFPA54 ANSI Z223.1. In Canada, refer to the National Standard CAN1-B149.1 or .2, which differs from this table.

**NOTE:** Check with louver manufacturers for Net Free Area of Louvers. Correct for screen resistance to the Net Free Area if a screen is used.

Table 3. Minimum Recommended Air Supply to Boiler Room

Exhaust Fans or Vents: Any equipment which exhausts air from the boiler room can deplete the combustion air supply or reverse the natural draft action of venting system. This could cause flue products to accumulate in the boiler room. Additional air must be supplied to compensate for such exhaust.

The information in Table 3 is not applicable in installations where exhaust fans or blowers of any type are used. Such installations must be designed by qualified engineers.

**NOTE:** Because the boiler control reduces the Boiler Target Temperature when outdoor temperature rises (to improve efficiency), there may be condensation forming in the vent or vent connectors at some times.

If a blower or fan is used to supply air to the boiler room, the installer should make sure it does not create drafts which could cause nuisance shutdowns. If a blower is necessary to provide adequate combustion...
air to the boiler, a suitable switch or equivalent must be wired into the boiler control circuit to prevent the boiler from firing unless the blower is operating.

The boiler must be completely isolated and protected from any source of corrosive chemical fumes such as those emitted by trichloroethylene, perchloroethylene, chlorine, etc.

3B. Venting

Vent Categories: The Mini-Therm JVS is a natural draft appliance for Category I venting only. The Mini-Therm JVH is a fan-assisted product that can be vented vertically in a properly-designed Category I system, or can be vented horizontally as a Category III appliance, per this installation manual.

When venting as a Category I, the boiler vent collar must be fastened directly to an unobstructed vent pipe with rustproof sheet metal screws no longer than 1/2” (13mm) and located to prevent interference with the inducer damper. Do not weld the vent pipe to the boiler collar. The weight of the stack must not rest on the boiler. The boiler top must be easily removable for normal boiler service and inspection.

When venting as a Category III horizontal, the venting requires a stainless steel system that is in compliance with the requirements of UL 1738 in the United States or ULC–S636 in Canada and in accordance with this section and with the venting system manufacturer’s instructions. Plastic venting of any kind is not permitted. The venting system must be attached to the boiler vent collar, using the appropriate Boiler Adapter. DO NOT ATTACH WITH SCREWS.

**WARNING**

This boiler must be vented in accordance with Part 7, Venting of Equipment, of the latest edition of the National Fuel Gas code, NFPA 54/ANSI Z223.1 and all applicable local building codes. Improper venting of this appliance can result in excessive levels of carbon monoxide which can result in severe personal injury or death!

**AVERTISSEMENT**

Cette chaudière doit être ventilé, conformément aux dispositions de la partie 7, de la ventilation de l'équipement, de la dernière édition du National gaz carburant code, NFPA 54/ANSI Z223.1 et tous les codes du bâtiment locaux. Une mauvaise ventilation de cet appareil peut entraîner des niveaux excessifs de monoxyde de carbone qui peut entraîner de graves blessures ou la mort!

**IMPORTANT**

Only JVH (induced draft) models may be side-wall vented without the addition of a properly sized and installed power venter.

JVS must be connected only using Category Type I methods. JVH may be connected per Category I or III methods and materials. See fuel gas code for more information regarding your venting application.

**IMPORTANT**

Seulement JVH (tirage induit) modèles peuvent être ventilés de la paroi latérale sans l’ajout d’une taille appropriée et puissance installée venter. JVS doit être connecté à l’aide de méthodes de Type I de la catégorie. JVH peut être connecté par catégorie I ou III Méthodes et matériaux. Voir code de gaz combustible pour plus d’informations concernant votre demande de ventilation.
Avoid terminating boiler vents near air conditioning or air supply fans. The fans can pick up exhaust flue products from the boiler and return them to the building, creating a possible health hazard. Avoid oversized vent pipe or extremely long runs of the pipe, which may cause excessive cooling and condensation.

3C. Vertical Venting - Category I (JVS and JVH)

All venting must comply with fuel gas code and be installed by a licensed professional.

The Mini-Therm JVS or JVH series boilers can be vented into a masonry chimney, (see Figures 3 and 4) provided several conditions are met:

1. The chimney must have an appropriate tile lining that is clean, properly constructed and properly sized.
2. The chimney passage way shall be examined to ascertain that it is clear and free of obstructions.
3. If a chimney rebuild is required, it shall conform to nationally recognized standards (see National Building Code or ANSI/NFPA 211).
4. The boiler must not be connected to a fireplace, wood stove or other solid fuel burning equipment.
5. When the boiler and a hot water heater are to be connected to the same chimney, they must have their own vent connector and enter the chimney at least 6” (152mm) apart.

**IMPORTANT NOTE:** Always provide a minimum clearance of 6” (152mm) between Type C (single wall) vent pipe and any combustible materials.

**WARNING**

Do not store any chemical, cleaners, or other corrosive material near combustion air openings or in the room. Avoid locating dryer vents in the vicinity of combustion air openings. Failure to prevent corrosive materials from mixing with combustion air can result in reduced boiler life and unsafe boiler operation.

**AVERTISSEMENT**

N'entreposer aucun produit chimique, produit nettoyant ou produit corrosif à proximité des bouches d'air de combustion ou dans la pièce. Éviter de placer des tuyaux de ventilation pour sécheuse à proximité des bouches d’air de combustion. Le fait de laisser des maîtresses corrosives se mêler à l’air de combustion risque de réduire le cycle de vie de l’appareil de chauffage et de compromettre son fonctionnement.

**WARNING**

Single wall vent pipe must NEVER pass through interior walls or through floors or ceilings! Failure to comply with this warning could result in a fire causing property damage, personal injury, or death!

**AVERTISSEMENT**

Paroi simple tuyau d'évent doit jamais passer par l'intérieur les murs ou par planchers ou plafonds ! Le non-respect de cet avertissement peut provoquer un incendie causant des dommages matériels ou corporels, ou de mort!

When installing the vent system, all applicable
national and local codes must be followed! The use of thimbles, firestops and other protective devices, when penetrating combustible or noncombustible construction, must be in accordance with all applicable national and local codes.

Vertical vents of the induced draft JVH boilers must be installed in accordance with the code requirement for Category 1, Fan Assisted Appliances. Follow the requirements as indicated in the latest edition of ANSI Z223.1/NFPA 54, sizing of Category I Venting System and Annex F, or in Canada, follow the instruction of CAN/CGA-B149 installation code.

An unused lined chimney can be used as a raceway for single wall vent pipe, (see Figure 3). Never run vent pipe through a flue that has another appliance attached to it.

3D-1. Horizontal Venting - Category III (JVH only)

Category III horizontal venting requires a stainless steel venting system that is in compliance with the requirements of UL 1738 in the United States or ULC-S636 in Canada and in accordance with this section and with the venting system manufacturer’s Instructions. Plastic venting of any kind is not permitted. The venting system must be attached to the boiler vent collar, using the appropriate Boiler Adapter. DO NOT ATTACH WITH SCREWS.

Common venting is not allowed in Category III systems unless designed and certified by a licensed Professional Engineer.

3D-2 Venting Connections (JVH only)

Refer to venting supplier’s instructions for complete parts list and method of installation. Table 1 lists the manufacturers of products that comply with the requirements of UL 1738 / ULC-S636 and the part numbers of component parts. Do not mix venting suppliers and models in venting systems. Failure to comply could result in personal injury, property damage, or death.

Installations must comply with applicable national, state and local codes. The entire vent system must not exceed the size specified in Table 2.

The following criteria must be observed:
1. If the horizontal run exceeds 5 ft (1.5 m) attach a vertical section of not less than 12 in. (305 mm) to the boiler vent collar using the appropriate adapter listed above.
2. Support the vent runs with overhead hangers at intervals specified in the vent system manufacturer’s instructions.
3. Pitch the vent run down toward the vent terminal ¼ in. per foot (20mm per m).

The venting system must be attached to the boiler vent collar, using the appropriate Boiler Adapter listed above. DO NOT ATTACH WITH SCREWS.

All JVH models are to be vented with a 4” diameter venting system of the equivalent length specified in Table 4. The venting system of the JVH-225 may be increased to 6” diameter to permit the longer equivalent length indicated in Table 4. When installing the 6” diameter system, install the Boiler Adapter to the boiler flue collar and an Increaser or Increasers to the Boiler Adapter to transition to the 6” diameter system.

Table 1. Allowable Single Wall Stainless Steel Vent Manufacturers and Part Numbers
### Horizontal Venting Configuration

#### Section 3D-3 Vent Termination (JVH only)

The sidewall vent terminal and thimble are a part of the vent system and must be selected from the chosen vent system Model numbers listed with the other vent system component parts in Section 3D-2. It provides a means of installing vent pipe through the building wall and must be located in accordance with ANSI Z223.1/NFPA 54, or in Canada CAN/CGA-B149 and applicable local codes (See Figure 6).

The location of the vent terminal should be chosen so that exiting flue products don’t come in contact with nearby shrubbery. In accordance with ANSI Z223.1/ NFPA 54, or CAN/CGA-B149, the terminal must be located 12” above grade or the anticipated snow level in areas where snow is expected. Follow any additional local codes when choosing the location.

#### Table 2. Horizontal Venting Configuration

#### 3E. Common Venting System

When an existing boiler is removed from a common venting system, the common venting system is likely to be too large for proper venting of the appliances remaining connected to it.

At the time of removal of an existing boiler, the following steps shall be followed with each appliance remaining connected to the common venting system placed in operation, while the other appliances remaining connected to the common venting system are not in operation.

1. Seal any unused openings in the common venting system.
2. Visually inspect the venting system for proper size and horizontal pitch and determine there is no blockage or restriction, leakage, corrosion or other deficiencies which could cause an unsafe condition.
3. Insofar as it is practical, close all building doors and windows and all doors between the space in which the appliances remaining connected to the common venting system are located and other spaces of the building. Turn on clothes dryers and any gas burning appliance not connected to the common venting system. Turn bathroom exhausts, so they will operate at maximum speed. Do not operate a summer exhaust fan. Close fireplace dampers.
4. Place in operation the appliance being inspected. Follow the lighting instructions. Adjust thermostat so appliance will operate continuously.
5. Test for spillage at the burner opening after five minutes of main burner operation.
6. After it has been determined that each appliance remaining connected to the common venting system properly vents when tested as outlined above, return doors, windows, exhaust fans, fireplace dampers and any other gas burning appliance to their previous conditions of use.
7. Any improper operation of the common venting system should be corrected so the installation conforms with the National Fuel Gas Code, ANSI Z223.1. When re-sizing any portion of the common venting system, the common venting system should be re-sized to approach the minimum size as determined using the appropriate tables in Appendix G in the National Fuel Gas Code, ANSI Z223.1/NFPA 54.
SECTION 4.
Gas Connections

4A Gas Supply and Piping

1. Gas piping installation must be in accordance with the latest edition of ANSI Z223.1 and all local codes. In Canada, the installation must be in accordance with CSA-B149.1 and all local codes that apply.

2. Check the gas supply to be sure that it is the same as the gas indicated on the boiler’s plate. Mini-Therm JVS and JVH boilers, as shipped from the factory, are certified to operate within the altitude range indicated on the rating plate. If a field conversion to a different altitude range or different gas should be necessary, conversion parts are available. Contact a Laars representative or the factory for the correct part numbers to order for conversions.

3. Use the figures in Table 6 to size the gas inlet piping from the gas meter to the heater. Check all local codes for compliance before installing the heater.

</tr>
</tbody>
</table>

**Note:** These figures are for Natural Gas (.65 Sp. Gr.), and are based on 1/2" water column pressure drop. Check supply pressure with a manometer, and local code requirements for variations. For LPG, reduce pipe diameter one size, but maintain a 1/2" minimum diameter. A 'normal' number of Tees and elbows have been taken into allowance.
4. A sediment trap (drip leg) must be installed ahead of the gas controls (see Figure 8). Fit the trap with a threaded cap which can be removed for cleaning.

5. Install a manual gas shutoff valve for service and safety. Do not use a restrictive gas cock. Flexible gas connectors, if used, must be CSA rated for the total input rating of the boiler.

6. Disconnect the boiler and its individual shutoff valve from the gas supply system during pressure testing of the system at pressures higher than 1/2 pounds per square inch (psi) (3.45 kilopascals [kPa]). If the test pressure is equal to or less than 1/2 psi (3.45 kPa), close the manual shutoff valve on the heater during the piping pressure test.

7. If the gas supply pressure is less than required, check for undersized pipe between the meter and the boiler, a restrictive fitting, or an undersized gas meter. Gas supply pressures to the heater are listed in Table 5.

**NOTE:** The boiler and all other gas appliances sharing the boiler gas supply line must be firing at maximum capacity to properly measure the inlet supply pressure. Low gas pressure could be an indication of an undersize gas meter and/or obstructed gas supply line.

8. The correct high fire burner manifold gas pressure is stamped on the rating plate. The regulator is pre-set at the factory, and normally requires no further adjustment. For two-stage units (JVS 100-225) be sure unit is able to fire at both high and low fire.

9. Before operating the boiler, the complete gas supply system and all connections must be tested for leaks using a leak detector solution. Do not use an open flame.

### 4B Special Precautions for LP Gas

LP Gas is heavier than air and can therefore more readily collect or “pool” in enclosed areas if provision for proper ventilation is not made. Be sure to pay special attention to proper ventilation for LP gas.

Locate boilers a safe distance from LP gas cylinders and filling equipment. In the United States, consult the “National Fuel Gas Code” (NFPA 54 / ANSI Z223.1, latest edition) or in Canada, the Propane Installation Code (CSA-B149.2), any local codes and fire protection authorities about specific installation restrictions in your area.

### SECTION 5. Water Connections

#### 5A. Water Piping

Figure 10. shows ‘typical’ plumbing installations. Be sure to provide unions and isolation valves at the boiler inlet and outlet so it can be isolated for service. Check local codes for specific plumbing requirements before beginning the installation.

An ASME pressure relief valve is supplied on all JV boilers, and is pre-set at 30 PSI. The valve outlet piping must discharge to a drain. Under no circumstances should the relief valve piping be a closed circuit.

A pressure reducing valve (automatic feed) must be used to maintain the system at constant proper pressure (see Figure 10). Supply properly installed purge valves to eliminate air from each circuit.

A drain valve is supplied with the boiler, and can be found in the plastic bag shipped with each boiler. This valve is to be installed on the lower right side of the boiler and is used for draining the unit. To drain the boiler completely, open the drain valve and remove...
the two drain plugs located on the lower left side of the boiler.
Be sure to include air vent devices located at the highest point in the system to eliminate trapped air, and an air elimination device near the outlet side of the JY boiler. Manual vent valves are recommended.
Hot water piping should be supported by suitable hangers or floor stands, NOT by the boiler. Due to expansion and contraction of copper pipe, consideration should be given to the type of hangers used. Rigid hangers could transmit noise through the system caused by the piping sliding in the hangers. It is recommended that padding be used when rigid hangers are installed.
Gas piping should also be supported by suitable hangers or floor stands, not the boiler. A properly sized expansion tank must be included in the system.

5B By-pass Piping
The following information and suggestions are made on by-pass piping as it affects the temperature rise at the boiler. A boiler temperature rise must be taken on all JY boiler installations. If the temperature rise exceeds 30°F (17°C) at full rate, it is an indication that the boiler is not receiving adequate water flow. Check the pump for any obstruction, replace the pump with a larger size where necessary, or install a system by-pass as indicated in Figures 10 and 11.
A full sized, 1¼" bypass with balancing valves is strongly recommended for all systems, and required when: 1) the boiler is installed without primary-secondary piping in a multiple zone system; 2) when the return water temperature can be expected to be lower than 120°F (44°C); or 3) whenever the system piping on the outlet side of the boiler may allow reduced flow through the heat exchanger, causing excessive temperature rise.

Note: Laars strongly recommends a primary/secondary piping system for all installations, especially sizes 125, 160 and 225. In this system, a circulator is dedicated to pumping the boiler only. This circulator should be sized for the boiler head loss and flow rate.

All precautions must be taken by the installer to insure that a maximum temperature rise through the boiler does not exceed 30°F (17°C). The temperature rise on boilers installed in multi-zone systems using zone valves must be taken when the zone of the longest length and/or the zone of the highest head loss is open.

A full size, 1¼" diameter by-pass with balancing valve must be installed if a return water temperature below 120°F (44°C) is expected under operating conditions regardless of boiler size. This may be expected in many systems, including in-floor radiant and snow melt systems.

5C Adjusting the bypass:
Refer to Figure 11. Provide a means of measuring temperature on the inlet pipe to the boiler such as using a strap on or infrared thermometer. Starting with both balancing valves fully open, start the boiler.
Adjust the balancing valve on the return to the system slowly to provide 120°F (44°C) water at the inlet to the boiler, leaving the bypass balancing valve fully open. As the system warms up, this valve may need to be adjusted open. In rare cases, this valve will have to be kept fully open, and the bypass balancing valve adjusted toward closed to prevent heated bypass water from satisfying the call for heat when the system is up to temperature.

5D Alternate Auto-Bypass Operation
Use of the Laars thermostatic union, p/n 2400-030, can provide automatic bypass operation in primary-secondary piped systems (but cannot be used when primary-secondary piping is not used). The thermostatic union is installed on the outlet piping, after the bypass assembly. It can provide automatic bypass operation in primary-secondary piped systems. The thermostat is adjusted toward closed to prevent heated bypass water from satisfying the call for heat when the system is up to temperature.

1. gpm = Water Flow in gallons per minute. l/s = Water flow in liters per second.
   ft = Pressure drop (headloss) through the boiler in feet of water. m = Pressure drop (headloss) through the boiler in meters of water.
2. Temperature rise and associated flow rates are based on high fire operation at the Normal Input Rate from the rating plate.

Notes: 1. Shaded area is the recommended flow and temperature rise.
Multi-Zone Pump System

Primary/Secondary Multi-Zone Valve System
Low Temperature Installation

Figure 10. Typical Plumbing Installations.
5E Flow Requirements

All high recovery, low volume water boilers must have adequate flow for efficient operation. Pump selection is critical to this goal, and pumps should be selected to provide for system design water temperature rise. Table 7 details temperature rise and water flow (GPM) for the Mini-Therm boilers.

Damage from improper flow is not warranteed.

Failure to insure proper water flow through the heat exchanger of the boiler will void the Laars warranty. Flow can be verified by measuring the difference in water temperatures between the boiler inlet and outlet. For example: For a JV-100 installation, the inlet water temperature is 160°F (71°C), and the outlet temperature is 180°F (82°C) at Normal Input Rate from the rating plate. That means there is a 20° (11°C) temperature rise through the boiler. According to Table 7, that would indicate a flow rate of 8 GPM (0.5L/S). Temperature rise must be measured with the longest (highest head) zone calling for heat alone. Other factors to be considered before selecting a pump are pipe size, the number of fittings throughout the system, smoothness of the interior surface of the pipe, the quantity of water flowing through the pipe, whether a glycol solution is being used, and the total length of piping in the system. Table 8 provides example pump selection criteria using Type L copper piping, one zone valve and up to eight elbows for single zone systems. Consult the factory or a qualified system designer if you have more fittings or different size or type of pipe.

*A circulator and/or primary/secondary piping are required. Consult factory.
1. Chart is based on 30°F (17°C) maximum temperature rise.
2. Calculations are based on Type L copper tubing with one zone valve and eight elbows.
3. Typical circulating pumps: 1/25 HP=Taco 007, B&G LR-20 or SLC-225, Grundfos UP15-42F, or equivalent. 1/12 HP=B&G series HV, Grundfos UP26-42F, or equivalent. 1/6 HP=B&G series HV, Grundfos UP43-75, or equivalent.

5F Chilled Water Systems

If the boiler is installed in conjunction with refrigeration systems, it shall be installed so that the chilled medium is piped in parallel with the heating boiler with appropriate valves to prevent the chilled medium from entering the heating boiler.

When boiler piping is connected to heating coils, which are in close proximity to refrigerated air circulation, there must be flow control valves or other automatic methods to prevent gravity circulation of the boiler water during the cooling cycle.

5G Oxygen Permeable Systems

The JV boiler must not be direct connected to a heating system utilizing oxygen permeable tubing. Provide a water-to-water heat exchanger between systems to prevent corrosion of ferrous metals such as the boiler’s piping wet walls, etc. Air elimination devices are not sufficient protection, and corrosion damage is not covered under the limited warranty.

5H Anti-Freeze

Non-toxic HVAC anti-freeze may be added to the hydronic system provided the concentration does not exceed 50%, and the anti-freeze contains an anti foamant and rust inhibitor. Follow the anti-freeze manufacturer’s recommendations for yearly or biannual replacement of system anti-freeze. Never use automotive anti-freeze in a boiler system.
51 Low Water Cut Off (LWCO)

When this boiler is installed above radiation level, it is required that a Low Water Cut-Off (LWCO) be installed unless this requirement is superceded by Jurisdictional requirements. Specific instructions for the installation are the following:

Locate the appropriate wiring diagram within this manual. There are two diagrams, one for the JVH Series and one for the JVS Series. These boilers are available for operation on 115/60 Hz or 220/50 Hz power. If this boiler is to be operated at 220/50 Hz use only a 24 VAC LWCO device. Depending upon the Voltage requirements of the chosen LWCO device (24 VAC or 120 VAC) wire the power wires for the device in the following manner: For 120 VAC LWCO devices, wire the power wires in parallel with the incoming supply power to the boiler. For 24 VAC LWCO devices, wire the power wires in parallel with the 24 VAC output from the boiler’s transformer.

On the appropriate wiring diagram, locate the HI LIMIT. Connect the switch contact wires from the LWCO device in series with the blue wire (JVH) or Orange wire (JVS) to the HI LIMIT. Follow LWCO device Manufacturer’s Wiring Instructions for identification of power wires and switch contact wires.

Mechanically, install the LWCO device in a tee fitting in the supply piping above the highest point of the boiler. Follow LWCO Manufacturer’s Instructions for minimum pipe sizing.

Perform a test of the Low Water Cut Off device according to its Manufacturer’s Instructions before leaving the boiler unattended.

Note: This boiler is a water tube boiler that requires water flow through the heat exchanger for proper operation. It does not have an operating water level and must be full at all times. In accordance with ANSI/ASME CSD-1 Section CW-210 and The National Fuel Gas Code ANSI Z223.1/NFPA 54 Section 10.3.5 a water tube boiler shall have a water flow proving device in lieu of a Low Water Cut Off.
5 J  Typical Plumbing Diagrams

The preferred piping configuration for JV boilers is always using primary/secondary piping. There are some applications that are acceptable without primary/secondary piping, see below.

**LOW TEMP SYSTEMS**

- **Primary/Secondary System Loop with Tempering Valve and Pump with Boiler Loop with Tempering Valve and Pump**

- **Primary/Secondary Piping with Automatic By-Pass**

- **Primary/Secondary Piping with Field Balancing (for Fixed Low Return Temperatures)**

- **Primary/Secondary Piping with Variable Speed Injection**

- **Primary/Secondary Piping with By-Pass (for Fixed Low Return Temperatures)**

**NON-LOW TEMPERATURE SYSTEMS**

- **(120°F + Return Temps)**

- **Tempering Valve with System Loop and Boiler Loop Pump**

- **Simple Primary/Secondary Piping - Hydronic - Not Low Temp**

Figure 12. Typical Plumbing Diagrams.

**NOTE:** All closed loop systems should include air elimination, expansion tank and feed water inlet. Place at point of lowest pressure (typically at the inlet of pump).

**NOTE:** Ball valves should not be used as balancing valves. Only use for shutoff apps.
SECTION 6.

6A. Electrical Wiring

Follow these instructions to make the necessary initial electrical connections.

1. Remove the two screws attaching the front cover of the control box.
2. There are wires coiled in the area on the right side of the control box, supplied with wire nuts: black wires and white wires.
3. Follow the schematic in Figures 14A. and 14B. Remove the wire nut from the two sets of wires, and connect the hot lead from the 115V power supply to the black wires and the neutral lead to the white wires.
4. Attach the leads from the wall thermostat to the terminal strip, located on the left side of the control box.
5. Check the boiler wiring and pump for correct voltage, frequency and phase. If the pump circuit is other than 115V, be sure there is an appropriate transformer or relay installed. The pump relay is suitable for pumps of 1/3 HP or less (max 5A).
6. For systems with multiple zone pumps or valves (see Figure 17).

A means of disconnecting the electrical supply must be provided within sight of the boiler. The pump and boiler must be wired as shown to insure that the pump is running whenever the boiler is firing.

Flow Switch: If the system includes a flow switch, it should be wired in series with the high-limit switch. The boiler will not fire unless the pump is running and the flow switch is closed.

Field installed safety devices and operating controllers, such as valve end switches, relays, timers, can be connected to the boiler through the wall thermostat circuit. Do not exceed a draw of 40VA on the transformer secondary. A 2-Amp fuse is here to protect the transformer.

6B. Outdoor Reset.

To comply with Federal Law, the Mini-Therm JV automatically sets water temperature based on outdoor temperature. A sensor (E2347400) supplied must be located outdoors yet out of direct sunlight. If not connected, the boiler may not be fully functional.

Connect the sensor to the terminals labeled "COM" and "OUTDOOR" located on the left side of the control box, using outdoor rated min 24 gauge wire. (See Figures 13A and 13B)
Figure 14A. Wiring Diagram, JVH

NOTE: 1. 4-PIN MOLEX AS VIEWED FROM REAR OF BOARD.

THE BOILER WILL NOT OPERATE WITHOUT THE AUTOMATIC VENT DAMPER. THE VENT DAMPER WIRE HARNESS MUST BE INSERTED INTO THE VENT DAMPER RECEPTACLE.

IN CANADA: SOME UNITS ARE SUPPLIED WITH VENT DAMPER JUMPER PLUG. DO NOT REMOVE JUMPER UNLESS VENT DAMPER IS TO BE INSTALLED.

LA CHAUDIÈRE NE FONCTIONNERA PAS SANS LE VOLET MOTORISÉ AUTOMATIQUE. LE F AISCEAU DU VOLET MOTORISÉ DOIT ÊTRE INSÉRÉ DANS LA PRISE DU VOLET MOTORISÉ.

SECTION 7.

7A Filling the System

It is crucial to the efficient operation of the system that all air be removed from the circuit. For this reason, an air scoop and vent should be located close to the boiler outlet, and there should be a minimum distance between cold water feed and system purge valve.

1. When the system has been completely installed, close all air vents and open the makeup water valve. Allow the circuit to fill slowly.

2. If a make-up water pump is employed, adjust the pressure to provide a minimum of 12 psi (83kPa) at the highest point in the circuit. If a pressure regulator is also installed in the line, adjust it to the same pressure.

3. Close all valves. Purge one circuit at a time as follows:
   a. Open one circuit drain valve and let water drain out for at least 5 minutes. Be certain there are no air bubbles visible in the water stream before closing the drain valve.
   b. Repeat this procedure for each circuit.

4. Open all valves after all circuits have been purged.

5. Run the system circulating pump for a minimum of 30 minutes with the boiler shut off.

6. Open all strainers in the system, and check for debris.

7. Recheck all air vents as described in Step 3.

8. If a Diaphragm Expansion Tank is utilized in the system, proceed to Step 13.
   Inspect the liquid level in the expansion tank, with the system full of water, and under normal operating pressure, to ensure proper water level in the expansion tank.

9. Start up boiler according to the procedures described in Section 2 and operate the system, including the pump, boiler, and radiation units, for one hour.

10. Recheck the water level in the expansion tank. If it exceeds 1/2 of the volume of the tank, open the tank drain and reduce the water level.

11. Shut down the entire system, and vent all radiation units and high points in the system.

12. Close the water makeup valve and check the strainer in the pressure reducing valve for sediment or debris. Reopen the water makeup valve.

13. Verify system pressure with the boiler pressure gauge before beginning regular operation.

14. Within 3 days of start-up, recheck and bleed all air vents and the expansion tank using these instructions.
SECTION 8. Operating Procedures

Before placing the boiler in operation, check and reset the safety shutoff devices. Once the boiler is connected to the gas and water piping and after all the requirements in previous pages have been met, follow these procedures:

8A. System Start-up

1. Verify that the pump system is operating properly:
   a. Shut off the manual gas valve located outside the boiler.
   b. Raise the wall thermostat high enough to call for heat.
   c. The pump should come on immediately. If it does not, test the electrical circuits.

2. Pilot and Main Burner Lighting:
   a. The JV boiler does not require manual lighting. The pilot is controlled by the automatic ignition system.
   b. Different models of the JV boiler utilize various gas valves. Although the gas valves may have different control knobs, they are all similar in operation.
   c. Understand and follow the operating instructions that are applicable to the type of ignition system installed on the boiler.

3. The pilot and main burners will automatically ignite when there is a call for heat.

   Note: Manual gas valve must be turned back on for this to happen.

8B. Sequence of Operation

1. Wall thermostat will call for heat.
2. Pump relay will turn on the circulating pump.
3. If water temperature is below the limit setting, the inducer motor relay will turn on the draft inducer (JVH).
4. Pressure switch will sense the fan (JVH only) operation and send 24 volts to the flame rollout switch.
5. In normal conditions, the flame rollout switch will be in a closed position. 24 volts will be sent to the gas valve/controller, the igniter will glow/spark and the pilot valve will open, lighting the pilot.
6. After pilot is proven to be lit, the main gas valve will open, the main burners will ignite and continue until either the primary control, hi-limit or wall thermostat opens.
7. When the wall thermostat is satisfied, the burners will shut off. The relays will turn off the draft inducer (JVH only) and the circulating pump, unless pump purge is selected. If selected, the pump will continue to run for 3 minutes. When the room temperature falls below the wall thermostat setting, the cycle will repeat.
8C. Operating Instructions
Mini-Therm JVH

OPERATING INSTRUCTIONS

1. STOP! Read the safety information above on this label.
2. Set the thermostat to lowest setting.
3. Turn off all electric power to the appliance.
4. THIS APPLIANCE IS EQUIPPED WITH AN IGNITION DEVICE WHICH AUTOMATICALLY LIGHTS THE PILOT. Do not try to light the pilot by hand.
5. Set ignition system control switch to "OFF".
6. Wait five (5) minutes to clear any gas. Then smell for gas, including near the floor. If you smell gas, STOP! Follow "B" in the safety information above (to the left) on this label. If you don't smell gas, go to next step.
7. Set ignition system control switch to "ON".
8. Set thermostat to desired setting.
9. Turn on all electric power to the appliance.
10. If the appliance will not operate, follow the instructions "To Turn Off Gas To Appliance" and call your service technician or gas supplier.

TO TURN OFF GAS TO APPLIANCE

1. Set the thermostat to lowest setting.
2. Turn off all electric power to the appliance if service is to be performed.
3. Set ignition system control switch to "OFF".

Pour votre sécurité, lisez avant de mettre en marche

AVERTISSEMENT: Quiconque ne respecte pas à la lettre les instructions dans la présente notice risque de déclencher un incendie ou une explosion entraînant des dommages, des blessures ou la mort.

A. Cet appareil est muni d'un dispositif d'allumage qui allume automatiquement la veilleuse. Ne tentez pas d'allumer la veilleuse manuellement.
B. AVANT DE FAIRE FONCTIONNER, renfilez tout autour de l'appareil pour décérécer une odeur de gaz. Renfilez près du plancher, car certains gaz sont plus lourds que l'air et peuvent s'accumuler au niveau du sol.
C. Ne laissez pas d'odeur de gaz.

INSTRUCTIONS DE MISE EN MARCHE

1. ARRÊTEZ ! Lisez les instructions de sécurité sur la portion supérieure.
2. Réglez le thermostat à la température la plus basse.
3. Coupez l'alimentation électrique de l'appareil.
4. Cet appareil est muni d'un dispositif d'allumage automatique de veilleuse. Ne pas tenter d'allumer la veilleuse à la main.
5. Set contact commutateur de contrôle du système sur la position "OFF".
6. Attendez cinq (5) minutes pour l'évacuer tout le gaz. Renfilez tout le gaz. Renfilez tout autour de l'appareil, y compris près du plancher, pour décérer une odeur de gaz. Si vous sentez une odeur de gaz.
ARRÊTEZ ! Passez à l'étape "B" des instructions de sécurité sur la portion supérieure (à gauche) de cette étiquette. S'il n'y a pas d'odeur de gaz, passez à l'étape suivante.
7. Set contact commutateur de contrôle du système sur la position "MARCHÉ".
8. Réglez le thermostat à la température désirée.
10. Si l'appareil ne se met pas en marche, suivez les instructions intitulées "Comment couper l'admission de gaz de l'appareil" et appelez un technicien qualifié ou le fournisseur de gaz.

COMMENT COUPER L'ADMISSION DE GAZ DE L'APPAREIL

1. Réglez le thermostat à la température la plus basse.
2. Coupez l'alimentation électrique de l'appareil s'il faut procéder à l'entretien.
3. Set contact commutateur de contrôle du système sur la position "OFF".
**8D. Operating Instructions**

**MINI-TERM JVS**

**OPERATING INSTRUCTIONS**

1. **STOP!** Read the safety information above on this label.
2. Set the thermostat to lowest setting.
3. Turn off all electric power to the appliance.
4. This appliance is equipped with an ignition device which automatically lights the pilot. Do not try to light the pilot by hand.
5. Turn gas control knob clockwise to "OFF".
6. Wait five (5) minutes to clear out any gas. Then smell for gas, including near the floor. If you smell gas, STOP! Follow "B" in the safety information above (to the left) on this label. If you don’t smell gas, go to next step.
7. Turn gas control knob counterclockwise to "ON".
8. Set thermostat to desired setting.
9. Turn on all electric power to the appliance.
10. If the appliance will not operate, follow the instructions "To Turn Off Gas To Appliance" and call your service technician or gas supplier.

**TO TURN OFF GAS TO APPLIANCE**

1. Set the thermostat to lowest setting.
2. Turn off all electric power to the appliance if service is to be performed.
3. Turn gas control knob clockwise to "OFF".

**AVERTISSEMENT:** Quiconque ne respecte pas à la lettre les instructions dans la présente notice risque de déclencher un incendie ou une explosion entraînant des dommages, des blessures ou la mort.

A. Cet appareil est muni d’un dispositif d’allumage qui allume automatiquement la veilleuse. Ne tentez pas d'allumer la veilleuse manuellement.

B. AVANT DE FAIRE FONCTIONNER, reniflez tout autour de l'appareil pour déceler une odeur de gaz. Reniflez près du panier, car certains gaz sont plus lourds que l'air et peuvent s'accumuler au niveau du sol.

**QUE FAIRE SI VOUS SENTEZ UNE ODEUR DE GAZ**

- Ne pas tenter d'allumer l'appareil.
- Ne toucher à aucun interrupteur; ne jamais servir des téléphones se tenant dans le bâtiment. Appelez immédiatement votre fournisseur de gaz depuis un voisin. Suivez les instructions du fournisseur.
- Si vous ne pouvez joindre le fournisseur, appelez le service des incendies.

C. Ne poussez pas l’appareil à l'extérieur du gaz à la main; ne jamais utiliser d'outil. Si l’appareil est coincé, ne tentez pas de le réparer; appelez un technicien qualifié. Le fait de forcer la manette ou de la réparer peut déclencher un explosion ou un incendie.

D. N'utilisez pas cet appareil s’il a été plongé dans l’eau, même partiellement. Faites inspecter l’appareil par un technicien qualifié et remplacez toute partie du système de contrôle et toute commande qui ont été plongés dans l'eau.

**INSTRUCTIONS DE MISE EN MARCHE**

1. ARRÊTEZ ! Lisez les instructions de sécurité sur la portion supérieure.
2. Réglez le thermostat à la température la plus basse.
4. Cet appareil est muni d’un dispositif d’allumage automatique de veilleuse. Ne pas tenter d’allumer la veilleuse à la main.
5. Tournez le bouton de commande dans le sens des aiguilles d’une montre pour le mettre en position d'arrêt “OFF”.
6. Attendre cinq (5) minutes pour laisser échapper tout le gaz. Reniflez tout le gaz. Reniflez tout autour de l'appareil, y compris près du panier, pour déceler une odeur de gaz. Si vous sentez une odeur de gaz, ARRÊTEZ ! Passez à l’étape “B” des instructions de sécurité sur la portion supérieure (à gauche) de cette étiquette. S’il n’y a pas d’odeur de gaz, passez à l’étape suivante.
7. Tournez le bouton de commande dans le sens contraire des aiguilles d’une montre pour le mettre en position de marche “ON”.
8. Réglez le thermostat à la température désirée.
10. Si l’appareil ne se met pas en marche, suivez les instructions intitulées "Comment couper l’admission de gaz de l'appareil" et appelez un technicien qualifié ou le fournisseur de gaz.

**COMMENT COUPER L’ADMISSION DE GAZ DE L’APPAREIL**

1. Réglez le thermostat à la température la plus basse.
2. Coupez l’alimentation électrique de l’appareil s’il faut procéder à l’entretien.
3. Tourner le bouton de commande dans le sens des aiguilles d’une montre pour le mettre en position d'arrêt “OFF”.
8.E Operating Temperature Controls

Note: The Temperature Controllers, the Dip switch panel, and the LED panel can be found under the Control Access Panel after removing the bolts.

Two temperature controls are now standard on all JVS and JVH boilers.
1. **The primary temperature controller** maintains all normal heating operations.
2. **A secondary, mechanical high-limit aquastat** provides safe shutdown, should the primary controller fail.

**Important:** If the secondary controller (**See Figure 18A and Figure 18B**) dial is set below 220°F, it may inhibit proper operation of the primary controller. Prior to calling for technical support, please ensure high limit control is set for at least **220°F**.

Off there is no post purge of the pump, the pump turns off immediately after the last call is removed. Laars strongly recommends using a pump post purge. During WWSD and a call for HEAT is present the pump will remain off.

**Pump Exercising** The control exercises the boiler pump every 3 days of inactivity. While the control is exercising the pump all LEDs will turn off and the power LED will flash for 10 seconds.

**Staging (where applicable – factory setting):**
Dip #1 is used to select the number of stages: 2-Stage (Off) / Single Stage (On).

**Note:** Use of 2-Stage operation may reduce efficiency.

For 2-stage operation, the first stage is cycled on Proportional error and the second stage is cycled based on PI according to a fixed algorithm. No user adjustment is necessary.

**Note:** All stages are turned off when the water outlet temperature reaches the Maximum setting that is elected via dip switch #4, Boiler Maximum 210°F (Off) / 190°F (On).

**Auto Boiler Target Setpoint: Space Heating:**
The boiler target temperature is automatically determined from Space Heating and DHW requirements. Space heating is based on outdoor reset. When both a Heat Call and a DHW Call are present at the same time, the control operates to provide the higher boiler target temperature.

**Heating Curve (Outdoor Temperature Reset)**
The control uses a linear heating curve to calculate a target setpoint. The following data are used to calculate the target setpoint from the outdoor temperature.

1. The heating curve or reset ratio (RR) is set by the potentiometer with a range of 0.4 to 3.6.
2. The room temperature is fixed at 70 deg F.

<table>
<thead>
<tr>
<th>Outdoor Temp</th>
<th>Heating Curve=Reset Ratio (RR)=</th>
<th>Boiler Target °F</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2.0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3.0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Reset Ratio Calculation:**
Boiler Target = 70 + RR *(70 - Actual Outdoor)

**Table 9**
**DHW Operation**  The boiler target for DHW calls is fixed at 180 deg F.  
Note: There is no control of a DHW pump, so the boiler pump runs with the call for DHW.  
**Limiting**  The boiler target is limited to a minimum and a maximum target to ensure that the water temperature does not exceed the limits.  
1. **Target Min** - The boiler target minimum is the point at which the stages will start to turn on to maintain a minimum water temperature. The Boiler Minimum water temperature is 150 deg F, regardless of other calculated targets. To ensure that the water temperature is greater than the Boiler Minimum water temperature the target is increased to allow the stages to cycle on by the Boiler Minimum water temperature, Boiler Minimum target is set to Boiler Minimum + differential/2.  
2. **Target Max** - The boiler target maximum is the point at which the stages will start to turn off to maintain a maximum water temperature. The Boiler Maximum water temperature is set by setting dip switch #4: Boiler Maximum 210°F (Off) / 190°F (On).  
   To ensure that the water temperature is less than the Boiler Maximum water temperature the target is decreased to allow the stages to cycle off by the Boiler Maximum water temperature, Boiler Maximum target is set to Boiler Maximum - differential/2.  

**NOTE:** If the outdoor sensor is not installed or is inoperative, the Target Max is automatically set at 140°F regardless of the Dip Switch #4 setting. This to comply with the requirements of the U.S. Department of Energy.  
**Auto Differential**  The control automatically adjusts differential to prevent short cycling and maximize the lifetime of components.  
**WWSD Operation**  Warm Weather Shutdown - WWSD feature is selected via dip switch #3, WWSD Inactive (Off) / Active 70°F (On). WWSD point is fixed at 70 deg F. Control exits WWSD when the outdoor temp falls to 65 F. When there is a call for HEAT and the control is in WWSD the HEAT call will be ignored. When there is a call for DHW and the control is in WWSD the DHW call will be satisfied. WWSD LED turns on when control detects WWSD.  

![Table 10. Efficiencies](image)

**Summary of Dip Switch Settings:**  
#1 Two Stage (Off) / Single Stage (On)  
(Note: Efficiency may be reduced with 2-stage operation.)  
#2 (Off) / Outdoor Reset (On) (Note: Outdoor Reset is required for residential operation)  
#3 WWSD Inactive (Off) / Active 70°F (On)  
#4 Boiler Maximum 210°F (Off) / 190°F (On)  
#5 Pump Post Purge Inactive (Off) / Active 3 min. (On)  
**LEDs Status & Description**  
1. **Power**  
2. **Heat** – On = call for heat; Flashes for Boiler sensor error  
3. **DHW** – On = call for DHW; Flashes for outdoor sensor error  
4. **WWSD** – On = Outdoor Reset AND WWSD Active AND control in WWSD; Flashes for outdoor sensor error, operation continues with fixed boiler target of 140°F.  

**Summary of Input Sensors:**  
1. **Outdoor sensor** - monitors the outside air temperature for outdoor reset mode  
2. **Boiler outlet sensor** - monitors the water temperature of the boiler outlet supply  
3. **System Supply sensor** - monitors the water temperature of the system supply  
The boiler outlet sensor is required at all times. If the boiler outlet sensor has any fault then the control will flash an error and turns all stages off. The system supply sensor is optional and utilizes primary / secondary piping. If the system supply sensor has a fault then the control flashes an error message and operates using the boiler outlet sensor (system supply = boiler outlet).

SECTION 9.
9A. Maintenance

1. Lubricate the water circulating pump per the instructions on the pump.

2. If a strainer is employed in a pressure reducing valve or the piping, clean it every six months.

3. At start-up, and periodically thereafter, the burner and pilot flames should be observed. If the flame has the appearance of “sooting” tips, check for debris near the orifices and call the service technician.

4. Ensure proper operation of the mechanical damper, mounted in the flue collar, by observing the damper handle. Be sure the handle swings when the draft inducer starts (depending on the boiler size, swing may be as little as 30°). Remove any obstructions and clean around the pivot rod (handle) holes.

5. Inspect the venting system for obstruction, leakage or corrosion at least once a year.

6. Keep the boiler area clear and free from combustible materials, gasoline, and other flammable vapors and liquids.

7. Be sure that all combustion air and ventilation openings are unobstructed.

8. Upon completion of the installation, inspect the external surfaces of the heat exchanger for fouling based on the following schedule:
   - 24 hours - 7 days - 30 days - 90 days
   - Once every six months thereafter.

9. If the boiler is not going to be used for long periods of time in locations where freezing occurs, it should be completely drained of all water. To accomplish this, there is a drain valve on the right side of the boiler which can be opened. This will drain the right side of the boiler. There are two plugs located on the left side of the heater which must be removed to drain that side. BOTH SIDES MUST BE DRAINED.

10. The gas and electric controls on the boiler are engineered for long life and dependable operation, but the safety of the equipment depends on their proper functioning. It is strongly recommended that the basic items listed below be inspected by a qualified service technician every year.
   a. Water temperature controls.
   b. Pilot safety system.
   c. Automatic gas valves.
   d. Fan proving switch.
   e. Inducer/Blower assembly.
   f. Mechanical flue damper operation.

**WARNING**
The Warranty does not cover damage caused by lack of required maintenance, lack of water flow, or improper operating practices.

**AVERTISSEMENT**
La garantie ne couvre pas les dommages causés par l'absence d'entretien, absence de débit d'eau, ou pratiques de fonctionnement irrégulières.

Fouling on the external surfaces of the heat exchanger is caused by incomplete combustion, and is a sign of venting and/or combustion air problems. The heat exchanger can be inspected by using a flashlight and placing a mirror under the burners. An alternate method is to remove the venting and top panel to inspect the exchanger from above. The vent system should be inspected at the same time. If cleaning is required:

   a. Shut off all power to the boiler.
   b. Remove the venting top, flue collector, draft inducer assembly, and heat exchanger baffles.
   c. Remove the burner tray.
   d. Use a hand-operated spray bottle filled with water, and a wire brush to clean soot and loose scale from the underside of the heat exchanger. DO NOT USE COMPRESSED AIR, HIGH PRESSURE WATER, OR A GARDEN HOSE.
   e. Clean any fallen debris from the bottom of the unit.
   f. Check to make sure the burner ports and pilot assembly are free of debris before returning the burner tray to its original position.
   g. Reassemble the boiler in reverse order, making sure to replace the heat exchanger baffles.
9B. Electrical Troubleshooting

1. Remove the control box cover on the front of the boiler.

2. Verify that 115 volts is reaching the boiler by testing across the black wire and the white wire on the transformer.

3. Verify 24 volts transformer output by placing the meter leads on the yellow and red wires. If 24 volts is not evident, replace the transformer. Perform the following series of tests with one meter lead attached to the yellow wire on the transformer.

4. Place the second lead on the “HEAT” connection on the terminal board. Turn the wall thermostat high enough to call for heat. If the meter fails to register 24 volts, the thermostat or its circuit may be defective.

5. Place the second lead on the purple wire terminal on the hi-limit switch. If no voltage across the switch, check for defective hi-limit, open circuit due to excessive water temperature, or a low temperature setting.

6. For JVH only, place the second lead on the blue wire terminal on the fan proving switch. If voltage is present, skip to step 8. If voltage isn’t present, connections or the draft inducer/motor could be defective.

7. Verify the voltage across the roll-out safety switch.

8. If it is determined that there is voltage to the gas valve, the pilot is lit and the pilot sensor is properly positioned, and the thermostat is set high enough to call for heat, the gas valve or the pilot assembly may be defective.

9. See Section 8E for LED's, Status & Description. What the LED's on the temperature controller mean.

SECTION 10. Replacement Parts

10A Glossary of Terms

Air Vent
A device used to purge air from the Circuit. Should be located at the highest point in the Circuit.

Branch
The section(s) of supply and return piping, including the heat distribution units connected directly to the trunk. Also referred to as a “zone”.

By-Pass
A section of pipe (including an adjustable valve) that diverts part of the water flow from undersized piping to the boiler. Adjusted to maintain minimum flow requirement (GPM) through the boiler.

Circuit
Entire water circulation piping, beginning and ending at the boiler (Series Loop System).

Expansion Tank (Compression Tank)
Installed in the circuit to accommodate excess water produced by heat expansion.

Diaphragm Expansion Tank
Used instead of Expansion Tank (Compression Tank). Internal bladder separates air and water.

Heat Distribution Units
Transfers heat from the water supplied by the boiler to the area to be heated through the use of baseboard, convector, radiator, finned tube. Also known as “radiation”.

Isolation Valve
Used to isolate the boiler from the circuit. It minimizes the amount of water drained from the system.

Primary-Secondary Piping
Two or more interconnecting circulating loops, each with its own pump. Primary = System Circuit; Secondary = Boiler Circuit.

Reverse-Return Piping
Balanced, equal flow (first in, last out) piping. Utilized with multiple boilers and/or radiation. Applied with single system pumps, or primary-secondary pump.

System Purge Valve
A device used to purge air from the circuit. Should be located as close as possible to the cold water feed, but not immediately after the cold water feed.

Temperature Controllers
The primary temperature controller maintains all normal heating operations. A secondary, mechanical high-limit aquastat provides safe shutdown, should the primary controller fail.

Trunk
The section of piping which connects the boiler return and supply with the branch(es). Also known as a “main” or “header”. Should be same size as boiler inlet/outlet connections.

Zone Pump
Circulators installed in branch piping that divert hot water coming from the boiler into various areas (zones) of a building.

Zone Valve
Diverts hot water from the boiler into various areas (zones) of a building.
## 10B Parts List JVH

### Mini-Therm JVH

|-------------|--------|--------|---------|---------|---------|---------|

### Gas System

1. **Pilots**
   - Pilot Assembly (Nat.), Hot Surface
     - **Description**: JVH-50: RW2001800
     - **Description**: JVH-125: RW2001800
     - **Description**: JVH-160: RW2001800
     - **Reference**: JVH-225: RW2001800
   - Pilot Assembly (LP), Hot Surface
     - **Description**: JVH-50: RW2001900
     - **Description**: JVH-125: RW2001900
     - **Description**: JVH-160: RW2001900
     - **Reference**: JVH-225: RW2001900

2. **Burner with Pilot Bracket**
   - **Description**: L0056500
   - **Reference**: L0056500

3. **Main Burner**
   - **Description**: L0052500
   - **Reference**: L0052500

4. **Main Gas Valves**
   - **Description**: Gas Valve, Hot Surface, (Nat.) SV9600H
     - **Reference**: R0384700
   - **Description**: Gas Valve, Hot Surface, (LP) SV950H
     - **Reference**: R0384800

5. **Gas Orifices**
   - **Description**: (0-2000 FT.) Nat., Orifices
     - **Reference**: L0032200
   - **Description**: (0-2000 FT.) Nat., Orifices
     - **Reference**: L0050700
   - **Description**: (5001-8000 FT.) Nat., Orifices
     - **Reference**: L0032600
   - **Description**: (8001-10,000 FT.) Nat., Orifices
     - **Reference**: L0050300
   - **Description**: (0-2000 FT.) LP, Orifices
     - **Reference**: L0032900
   - **Description**: (5001-8000 FT.) LP, Orifices
     - **Reference**: L0032800
   - **Description**: (8001-10,000 FT.) LP, Orifices
     - **Reference**: L0032700
   - **Reference**: L0052601

### Electrical System

7. **Controller, Tekra**
   - **Reference**: RE2344300

8. **Transformer65/24V(50VA)**
   - **Reference**: E2074400

9. **Switch, Air Pressure (0-10000 FT.)**
   - **Reference**: E2074500

10. **Blower/Motor, Induced Draft**
    - **Reference**: R2069600

11. **Switch, Roll-out Safety**
    - **Reference**: E21032000

12. **Switch, Limit**
    - **Reference**: R0061300

13. **Ignition Control**
    - **Reference**: E2102800

14. **Wire Harness (not shown)**
    - **Reference**: E2347500

15. **Fuse, 5-Pack, 4-Amp (not shown)**
    - **Reference**: RE0084401

16. **Temp Sensor (not shown)**
    - **Reference**: E2347500

17. **Outboard Sensor (not shown)**
    - **Reference**: E2347400

### Water System

18. **Heat Exchanger**
    - **Reference**: R0402007

19. **Gauge, Temperature/Pressure**
    - **Reference**: A2000404

20. **Valve, Pressure Relief 30 PSI**
    - **Reference**: R0061400

21. **18A Well, Immersion, 1/2" NPT**
    - **Reference**: E0025902

22. **18B Well, Immersion, 3/4" NPT**
    - **Reference**: E2345700

23. **Valve, Drain 1/2" NPT**
    - **Reference**: 70-270

### Jacket and Fire Box Components

24. **Base Weldment**
    - **Reference**: 20400701

25. **Front Panel**
    - **Reference**: 11028301

26. **Jacket**
    - **Reference**: 11027901

27. **Cover, top rear**
    - **Reference**: 11028501

28. **Cover, top front**
    - **Reference**: 11028401

29. **Access Panel, heat exchanger plug**
    - **Reference**: 10535900

30. **Cover, piping jacket top**
    - **Reference**: 11047601

31. **Flue Collector Weldment**
    - **Reference**: 20403305

32. **Tile Cover**
    - **Reference**: 10469504

33. **Heat Exchanger Baffle**
    - **Reference**: 10485307

34. **Front Refractory**
    - **Reference**: T2007704

35. **Rear Refractory**
    - **Reference**: T2007804

36. **Orifice Plates**
    - **Reference**: 20404605

37. **Flue Outlet**
    - **Reference**: D2004201

38. **Bracket, pressure switch**
    - **Reference**: 11028200
